These were tested on a panel Mesembrine of receptors, enzymes and other drug targets, and for cytotoxic effects on mammalian cells. Mesembrenone Results: The extract was a potent blocker in 5-HT transporter binding assays (IC, 0 4.3 μg/ml) and had pow-Phosphodiesterase Serotonin transporter erful inhibitory effects on phosphodiesterase 4 (PDE4) (IC_{50} 8.5 µg/ml), but not other phosphodiesterases. Selective serotonin reuptake inhibitor There were no cytotoxic effects. Mesembrine was the most active alkaloid against the 5-HT transporter $(K_i 1.4 \text{ nM})$, while mesembrenone was active against the 5-HT transporter and PDE4 (IC_{50} 's < 1 μ M). Anti-depressant Conclusions: The activity of the Sceletium tortuosum extract on the 5-HT transporter and PDE4 may explain the clinical effects of preparations made from this plant. The activities relate to the presence of alkaloids, particularly mesembrine and mesembrenone. © 2011 Elsevier Ireland Ltd. All rights reserved.

1. Introduction

Sceletium tortuosum is a succulent plant which is not genous to South Africa and belongs to the family Mesembryan the naceae (Smith et al., 1996; Klak et al., 2007). It has a long his ory of traditional use, and more recently, it has attracted attention for its possible utility in supporting and promoting a sense of well-being in healthy people, and treating people with anxiety, stress or depression (for review see Gericke and Viljoen, 2008). Eight species

Abbreviations: 5-HT, 5-hydroxytryptamine; n, adenosine receptor, ΔT , angiotensin receptor; BZD, be iz diazepine; B₂, bradykinin receptor, CG P, calcitonin gene related peptide; CB, cannabinoid receptor; CCK, choled vstokinin: D_a. dopamine receptors; EHNA, erythro-9-(2-hydroxy-3-nonyl)adenine; ET, endothelin; GAL, galanin; H1, H2, histamine receptors; IBMX, 3-isobutyl-1-me hylx anthine; MC, melanocortin; M Γ, mela onin; M1-M₅, muscarinic cholinoceptors; NK, neurokinin; NPY, neuropetide Y receptors; NT, neurotensin; $n_{\rm H}$, slope factor from Hill plot; DOP, δ₂ opioid receptors; KOP, κ opioid receptors; MOP, conioid receptors (MOP); NOP, orexin ORL1 receptors; PCP, phencyclidine; PD E, phosphodiesterase; PDGF, platelet-derived growth factor; EP, prostaglandin; TP, thromboxane A. (TXA2/PG H2) receptors; PGI₂, prostacyclin; P2X, P2Y, ATP receptors; sst. somatostatin; GR, glucocorticoid receptors; VIP, vasoactive intestinal peptide.

* Corresponding author. Tel.: +44 141 553 4155; fax: +44 141 552 8376 E-mail address: a.l.harvey@strath.ac.uk (A.L. Harvey). of Sceletium are generally recognised (S. crassicaule, S. emarcidum, S. exalatum, S. expansum, S. rigidum, S. strictum, S. tortugsum and S. varians), although Klak et al. (2007) suggested that the Sceletium group is more properly classified as: Mesembryanthemum crassicaule, M. emarcidum, M. exalatum, M. expansum, M. archeri (=S. rigidum), M. ladism thiense (=S. strictum), M. tortuosum and M. varians. The chemistry of various Sceletium species has been extensively studied, although the focus appears to have been exclusively on alkaloids: The Dictionary of Natural Products (2011) gives details of 31 different alkaloidal components from five sources of Sceletium (S. joubertii, S. namaquense [both now placed under synonomy with S. tortuosum], S. strictum, S. subvelutium [also now within the species concept of S. tortuosum], and S. tortuosum). Sceletium tortuosum is known to contain at least mesembrine, mesembranol, mesembrenol, mesembrenone, alkaloid A4, chennaine and tortuosamine (Gericke and Vilipen, 2008).

Despite the interest in the possible use of *Sceletium* extracts or alkaloids in medicinal and dietary supplements, very little experimental pharmacological work has been published. Mesembrine, isolated from *Sceletium tortuosum*, was shown to be a potent inhibitor of 5-hydroxytryptamine (5-HT) reuptake (JS Patent, 2001), and this was confirmed with synthetic (–)-mesembrine. Its IC₅₀ against 5-HT uptake was 27 nM, with much weaker effects on

3

Fig. 1. Chemical structures of *Sceletium* alkaloids. **1**, mesembrine; **2**, mesembrenone; **3**, mesembrenol.

noradrenaline uptake (IC $_{10} \sim 10 \, \mu\text{M}$) and no effect on dopamine uptake at $10 \, \mu\text{M}$ (Gericke and Viljoen, 2008). Mesemble end has been tested for cytotoxic effects on three cell lines (We niger et al., 1995). It was found to affect a human T cell lymphoma cells) with an EC $_{50}$ of $\sim 2 \, \mu\text{M}$ ($0.6 \, \mu\text{g/ml}$), but to have litted a hepatoma cell line (Hep G2) or on a mouse fibroblast cells; EC $_{5}$ $_{10} \, \mu\text{g/ml}$). Mesembrine and synthetic analogues were shown to inhibit phosphodiesterase 4 (PDE4) activity (Napoletano et al., 2001). Mesembrine itself was a very weak PDE4 in hibitor (IC $_{50} \, 29 \, \mu\text{M}$) but some synthetic analogues were considerably more active, with IC $_{50}$'s of $0.1-1 \, \mu\text{M}$.

There have also been a few published *in vivo* studies with *Sceletium tortuosum*. In animal studies, repeated oral doses of dry powdered plant material were shown to have no toxic effects and dogs (Hirabayashi et al., 2002, 2004). The authors also reported that the plant material had beneficial effects in cats with signs of stress and dogs showing signs clinically diagnosed as dementia. The latter effects were reported to be confirmed in a nore extensive study on dogs (Hirai et al., 2005). More recently, a *Sceletium* extract was tested in rats in an immobilisation stress model (Smith, 2011) where it was found to have positive effects on psychological stress. Human volunteers taking a *Sceletium* preparation reported anxiolytic effects (US Palent, 2001).

The present work was undertaken to conduct a broad plarmacological profiling of a proprietary standardised extract of Scrietium tortuosum known as Zembrin® and three main alkaloids, niese nbrenol, mesembrenone, and mesembrine (Fig. 1).

2. Materials and methods

2.1. Extract and alkaloids

The above ground parts of a naturally occurring low-mesembrine chemotype of *Sceletium tortuosum* cultivated commercially by the company Niche Botanicals (Pty) Ltd., Sputh Africa were harvested and air-dried before extraction. The plant: extract ratio was 2:1 by weight, with the solvent being 70% et han ol, 30% water by volume. The plant extract was spray-dried or a conventional inert carrier.

To isolate Sceletium alkaloids, 500 g of dried plant material of the low-mesembrine chemotype was extracted with 0.25 M sulfuric adid (3 × 6L), shaken and left to settle for 10 min before filtration. The process was repeated three times and the filtrates were made all aline with 20% aqueous ammor ia solution (750 ml) and the alkaloids were recovered with dichloromethane (3 × 875 ml). The alkaloid-rich extract was subjected column chromatography followed by high-speed countercurrent chromatography. The alkaloid content of the extract Sceletium tortuosum Zembrin® was 0.42% weight by weight ative amount of the three key mesembrine-alkaloids in the extract, quantified by HPLC analysis against validated analytical reference compounds, conform to the following profile: mesem-

brenone + mesembrenol > 70%, mesembrine < 20%. The purities of each of the isolated compounds were confirmed by GC-MS. This latter technique was also used to determine the molecular masses of 1–3. The structures of 1–3 were confirmed from the MS data and from published NMR data (Jeffs et al., 1970).

2.2. Radioligand binding assays

Extract and isolated compounds were tested on a panel of 77 radioligand binding assays (Cerep, France; http://www.cerep.fr/ cer<u>e</u>p/us<u>er</u>s/pages/catalog/p_ProfileCatalogue.asp?prpfile=2118): ader osine A_1 , A_{2A} , A_3 , α_1 adrenoceptors (non-selective); α_2 adrenoceptors (non-selective); β_1 adrenoceptors, β_2 adrenoceptors, angiotensin AT₁ receptors, AT₂ receptors, benzodiazepine (BZD) binding sites (central); BZD peripheral binding sites; bombesin receptors (non-selective): racykinin B₂ receptors, CGRP receptors, cannabinoid CB₁ receptors, cholecystokinin CCK_A (CCK_1) receptors, QCK_B (CCK_2) receptors, dopamine D_1 receptors, D₂₃ receptors, D₃ receptors, D_{4,4} receptors, D₅ receptors, endothelin ET_A receptors, ET_B receptors, GABA receptors (non-selective), galanin GAL1 receptors, GAL2 receptors, platelet-derived growth factor PDGF receptors, histamine H₁ receptors, H₂ receptors, m landcortin MC₄ receptors melatonin MT₁ receptors, muscarinic choling eptors M₁, M₂ receptors, M₃ receptors, M₄ receptors, M₅ receptors, neurokinin NK receptors, NK receptors, NK receptors, neuropetide Y receptors, Y₂ receptors, reurotensin NT receptors (NTS1), nicotinic cholinoceptors (n_0 uronal) (α -BGTX-insensitive <u>– α4β2), nicotinic cholinoceptors (neuronal) (α-BGTX-</u>sensitive – α 7), δ_2 opioid receptors (DOP), κ opioid receptors (KOF), μ opioid receptors (MOP) (agonist site), orexin ORL1 receptors (NOP), NMDA receptors (phencyclidine PCP binding site), prostaglandin E EP₄ receptors, the onboxane A_2 (TP) receptors (TXA₂/PGH₂), prostacyclin (PGI₂), ATP P2X receptors, P2Y receptors, 5-HT_{1A} receptors, 5-HT_{1B} receptors, 5-HT_{2A} receptors, 5-HT_{2C} receptors, 5-HT₃ receptors, 5-HT_{5A} receptors, 5-HT₆ receptors, 5-HT₇ receptors, σ receptors (non-selective), somatostatin (sst) (non-selective), glucocorticoid receptors (GR), vasoactive intestinal peptide VIP₁ receptors (VPAC₁), vasor ressin V_{1a} receptors, Ca²⁺ dhannel (L, verapamil site) (phenylall ylarhines), K_{V}^{\dagger} channel, SK_{ca}^{\dagger} channel, Na⁺ channel (site 2), Cl-channel (GABA-gated), noradrenaline transporter, dopamine transporter, and 5-HT transporter.

Experiments were performed in duplicate. The specific ligand binding to the receptors was defined as the difference between the total binding and the nonspecific binding determined in the presence of an excess of unlabelled ligand. The results are expressed as a percent of control specific binding ((measured specific binding/control specific binding) × 100) obtained in the presence of test malerials. The IC₅₀ values (concentration causing a halinhibition of control specific binding) and Hill coefficients $(n_{\rm H})$ were determined by non-linear regression analysis of the competition curves generated with mean replicate values using Hill equation curve fitting $(Y = D + [(A - D)/(1 + (C/C_{50})^{n_{\rm H}})]]$, where Y is the specific binding, D the minimum specific binding, D the maximum specific binding, D the compound contentration D, D and D is the slope factor).

2.3. Phosphodiesterase activity assays

The following PDE enzymes were used along with corresponding reference compounds: PDE1 (bovine brain) with 8-methoxy-IBMX, PDE2 (differentiated U-937 cells) with EHNA, PDE3 (human platelets) with milrinone, PDE4 (U-937 cells) with rolipram, PDE4B and PDE4D, both human recombinant expressed in Sf9 cells, with rolipram, PDE5 (human platelets) with dipyridamole, PDE6 (bovine retina) with zaprinast, PDE7A human recombinant expressed in Sf9 cells, with BRL50481, PDE8A human recombinant

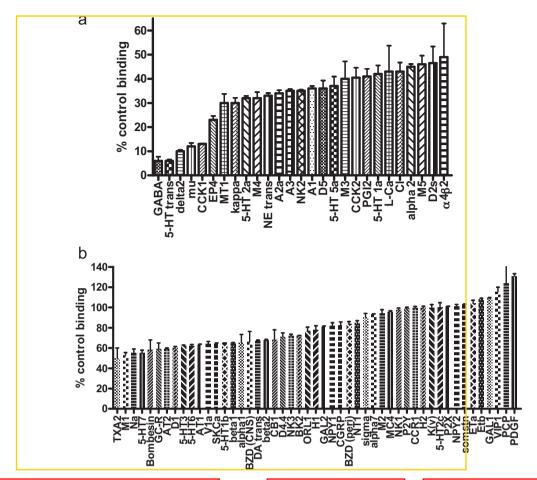

Fig. 2. Binding sites at which the extract Sceletium tortuos m Zembrin (750 µg/ml) caused (a) more and (b) less than 50% inhibition of the control binding.

expressed in Sf9 cells, with dipyridamole, PDE10A human recombinant expressed in Sf9 cells, with papaverine, and PDE 1A human recombinant expressed in Sf9 cells, with dipyridamole. Production of [3H] 5'AMP from [3H] cAMP (PDEs 1-4) or [3H] cGMP (PDEs 5 and 6) was measured by scintillation counting after 60 min incubation at 22 °C. For PDE4B and 4D, PDE8A, PDE10A and PDE11A, residual cAMP was measured by time-resolved fluorescence after 30 min at 22 °C. The results are expressed as a percent inhibition of control specific activity (100 – ((measured specific activity/control specific activity) \times 100)) obtained in the presence of test material.

greater than 90-95% confluency at the end of the incubation period in complete medium and were allowed to adhere overnight before they were treated with a range of extract Sceletium tortuosum (Zembrin®) and alkaloid concentrations. The cells were incubated for 24h before cell viability was determined using the Alamar Blue^{IM} growth inhibition assay (O'Brien et al., 2000).

L-glutt mine, 10% FBS and penicillin (100 units/ml)–streptomycin (100 µg/ml) (media and supplements were purchased from Invitrogen, Paisley UK). HepG2 and HS27 cells were plated in 96-well plates (100 µL per well) at a concentration which allowed no

2.4. Cholinesterase activity assays

Extract Sceletium tortuosum (Zembrin®) and the alkaloids were tested for their inhibitory effect against acetylcholinesterase (electric eel) and butyrylcholinesterase (equine) based on Zhou's method (Zhou et al., 1997). Briefly, cholinesterase (acetyl or butyryl) converts acetylcholine chloride to choline and acetate, choline is then oxidized by choline oxidase to form betaine and H₂O₂. Hydrogen peroxide, in a 1:1 stoichionnetry with 10acetyl-3,7-dihydroxyphenoxazine (Amplex Red reagent), in the presence of horseradish peroxidase, generates resorufin which is monitored by fluorescence output excitation 560 nm, emission 590 nm).

2.5. Cytotoxicity assays

The cell lines HepG2 and HS27 were grown in complete medium at 37 °C in a humidi ied 5% CO₂ atmosphere. The medium

3. Results

3.1. Binding assays with extract

The extract Sceletium tortuosum Zembrin® was screened at 750 µg/ml on a panel of 77 receptor and ion channel binding sites. The concentration of extract was chosen because it should contain approximately 10 µM of mesembrine-like alkaloids and previous screening studies detected activity of mesembrine at concentrations below 10 \(\mu M \). The results have been plotted to show the binding sites at which the extract caused more than 50% inhibition of binding (Fig. 2a) and those with less than 50% inhibition (Fig. 2b)

was DMEM supplemented with 1 mM sodium pyruvate, 2 mM

As can be seen from Figs. 1 and 2, most of the binding sites were little affected by the presence of extract. However, the extract had marked effects (>80% inhibition of binding) at a small number of sites: GABA receptors, 5-HT transporter, δ_2 -opioid receptors, μ -

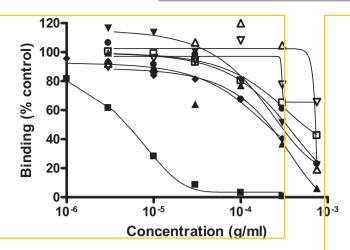

Fig. 3. Competition curves for the extract Sceletium tortuosum Zembrin® against the selected target sites. Filled square, 5-HT transporter; filled upward triangle GABA-A receptors; filled downward triangle, μ-opioid receptors; filled diamond, or opioid receptors; filled circle, EP4 receptors; open square, MT1 melatonin receptors; open downward triangle, CCK1 cholecystokinin receptors; open downward triangle, GABA-B receptors.

opioid receptors, and cholecystokinin-1 (or -A) receptors. Binding at the EP4 subtype of receptor for prostaglandin E2 was in hibited by 77%, but all others were inhibited by less than 70%. If a narbitrary threshold for "important" binding is taken at inhibition of 80% or greater, then the extract acts on the five sites listed above: namely GABA receptors, 5-HT transporter, δ_2 -opioid receptors, and cholecystokinin-1 (or -A) receptors.

Based on the positive findings from the broad screening experiment, follow-up studies were performed to establish the concentration-dependency of the extract and its potency at key target sites: 5-HT transporter, GABA-A and GABA-I receptors, δ_2 -opioid receptors, μ -opioid receptors, cholecystokinin-1 (or -A) receptors, EP4 prostaglandin receptors and melatonin-1 receptors (Fig. 3). The extract had potent, concentration-dependent at the 5-HT transporter. The effects on the other sites were generally concentration-dependent but much higher concentrations of extract were needed to cause inhibition of binding. The calculated IC_{50} values and the Hill coefficients are shown in Table 1.

3.2. Effects on phosphodiesterase and cholinesterase activities

The extract Sceletium tortuosum Zembrin® was tested at 750 µg/ml on activity of a panel of phosphodiesterases (Fig. 4). PDE4 activity was completely inhibited, and that of PDE3 was reduced by 88% (range 87–89%). The other enzymes were less inhibited: PIE1 by 27% (range 23–32%), PDE2 by 33% (range 30–36%), PDE5 by 29% (range 28–30%), PDE6 by 29% (range 27–31%), PDE7A by 34% (range 31–37%), PDE8A by 4% (range 2–6%), PDE1 0A by 49% (range 48–50%), and PDE1 1A by 50% (range 46–54%). In addition,

CCK1	676	14.1
GABA-B	>750	Nd

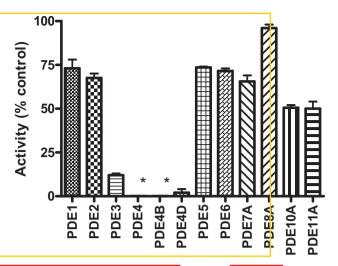

Fig. 4. Effects of the extract *Sceletium tortuo* um Zembrin® (750 μg/m) on different phosphodiesterases.

the extract was tested on two subtypes of PDE4: 4B and 4D. Extract at 750 µg/ml abolished the activity of both subtypes of PDE4.

Follow-up studies were performed to establish the concentration-dependency of the extract's effects on PDE3 and PDE4. Both were inhibited in a concentration-dependent manner, although the extract was more potent against PDE4 (IC₅₀ 8.5 µg/ml) than against PDE3 (IC₅₀ | 274 µg/ml).

When tested at concentrations up to 300 µg/ml on activity of cholinesterases, the extract reduced activity of acetylcholinesterase by 7% and that of butyrylcholinesterase by 25%.

3.3. Effect of extract Sceletium tortuosum (Zembrin®) and isolated alkaloids on proliferation of mammalian cells

Extract $(0.1 - 100 \,\mu g/ml)$ and the alkaloids mesembrine, mesembrenol and mesembrenone $(0.1 - 100 \,\mu M)$ had no effect on the growth or viability of HS27 and HepG2 cells following 24 h exposure (data not shown).

3.4. Effects of isolated alkaloids on 5-HT transporter and other binding sites and on PDE4 activity

Mesembrenol, mesembrenone and mesembrine were tested at 3 μM in the binding and enzymatic assays in which the Sceletium extract had previously been shown to have activity. The results are summarised in Fig. 5. All three alkaloids blocked binding to the 5-HT transporter, but had little effect on binding at GABA-A and GABA-I receptors, δ₂-opioid receptors, μ-opioid receptors, cholecystokinin-1 (or -A) receptors, EP4 prostaglanding and melatonin-1 receptors. Only mesembrenone had positive ent effects at PDE 4A and 4B.

The three alkaloids were also tested at concentrations up to 300 µM on activity of acetyl- and butyryl-cholinesterase. None of the compounds reduced activity of acetylcholinesterase by more than 5–10%. Butyrylcholinesterase activity was not affected by 300 µM mesembrenone or mesembrenol, but it was reduced by 38% by 300 µM mesembrine.

The three alkaloids were studied for their effects across a broad range of concentrations on binding to the 5-HT transpoter and on activity of PDE4B. In all cases, concentration-dependent inhibition was found. The results are summarised in Table 2. In the 5-HT transporter assay, mesembrine was the most active compound, being 20 times more potent than mesembrenone and 87 times more active than mesembrenol. In the PDE4B assay, the most potent compound

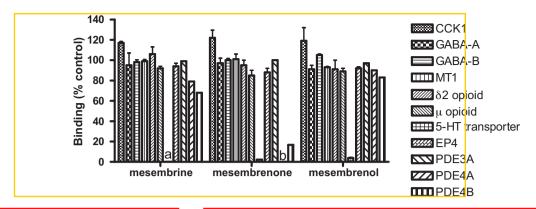

Fig. 5. Effects of mesembrine, mesembrenone and mesen hbrenol (all at 3 μM) in binding and PDE assays. Values are mean of 2 separate assays with bars indicating the upper ange. a, 100% block at 5-HT transporter; b, 100% block at PDE4A.

was mesembrenone, which was 17 times more potent than nesembrine and 34 times more active than mesembrenol.

4. Discussion

There is interest in the possible use of Sceletium preparations in functional foods, beverages and supplements for promoting health and wellness in healthy people, in people experiencing stress, and for treating people with a variety of psychological and psychiatric disorders including anxiety and depression (Gericke and Viljoen, 2008). Despite the long documented history of the plant being used as a masticatory, health tea, and as a herbal medicine, there are few reports on its pharmacological activity (Smith et al., 1996). Its claimed effectiveness in cases of depression has been linked to inhibitory effects on 5-HT reuptake (Gericke and Viljoen, 2008), although such effects have not been extensively studied. The present results demonstrate that the proprietary standardised extract of Sceletium tortuosum known as Zembrin® does have potent inhibitory effects on the 5-HT transporter. Considering that a plant extract will have several hundred components, it is perhaps surprising that the Sceletium extract affected so few sites in the extensive panel of receptors, ion channels, transporters and enzymes used in this study. Potent inhibitory activity was also found against PDE4 and, to a lesser extent, PDE3, but not to other PDEs. There were also significant reductions in binding of radioligands at a few receptors: GABA receptors, δ_2 opioid receptors, μ-opioid receptors, cholecystokinin-1 (or -A) receptors, EP4 prostaglandin receptors and melatonin-1 receptors. However, the concentrations needed were 30-150 times greater than those needed with the 5-HT transporter assays. Consequently, clinical effects of extract Sceletium tortuosum (Zembrin®) are likely to stem from their inhibitory effects on 5-HT uptake processes and PDE4 activity. Selective serotonin reuptake inhibitors are well-known as antidepressants, and PDE4 inhibitors have also attracted considerable attention as potential antidepressants, although the pharmaceutical compounds tested clinically have had dose-limiting side effects of nausea and emesis (Kanes et al. 2007) There is substantial experimental evidence from animal models

Table 2
Summary of analyses of the concentration-response curves of the three alkaloids on binding to the 5-HT transporter and on activity of PDE4B.

Compound	5-HT transporter		PDE4B
	K_{i} (nM)	n_{H}	IC ₅₀ (nM)
Mesembrine	1.4	1.0	7800
Mesembrenone	27	1.0	470
Mesembrenol	62	1.1	16,000

 $n_{\rm H}$, Hill coefficient.

that PDE4 inhibitors can reverse depression, improve and alleviate anxiety (O'Donnell and Zhang, 2004; Rutten et al., 2006). There is also a positive finding in an animal test of a PDE4 inhibitor relating to schizophrenia (Kanes et al., 2007) and there is evidence for a synergistic effect of PDE4 inhibition combined with monoamine-uptake inhibitors (Fujimaki et al., 1999). Therefore, the finding that the extract *Sceletium tortuosum* Zembrin[®] was a powerful inhibitor of both 5-HT uptake and PDE4 activity could be highly significant in terms of its health application in humans. Recently, the therapeutic advantages of dual 5-HT uptake inhibition and PDE4 inhibition have been discussed (Cashman et al., 2009), and include the possibility of using a lower dose to achieve enhanced efficacy with a reduced side-effect profile.

In order to establish the most likely active components of extract *Sceletium tortuosum* (Zembrin®), the activities of the isolated three main alkaloids present in the extract (mesembrenol, mesembrenone and mesembrine) were studied on the 5-HT transporter, and on PDE4. All three were potently active in the 5-HT transporter binding assay ($K_{\rm i}$ s 1–60 nM) and against PDE4B activity (IC₅₀'s 0.5–16 μ M). Mesembrenone is the closest to being a "dual-acting" 5-HT uptake and PDE4 inhibitor because the difference between concentrations for 50% effect on the two assays was 17 times, whereas it was 258 times for mesembrenol and 5500 for mesembrine. Conversely, mesembrine was the compound showing most selectivity for the 5-HT transporter over PDE4B.
